

Good: $\mathrm{diam}_{\mathbb{E}^3}(\tilde{L}_n)$ is small

$\tilde{L}_n$ is quasi-totally geodesic

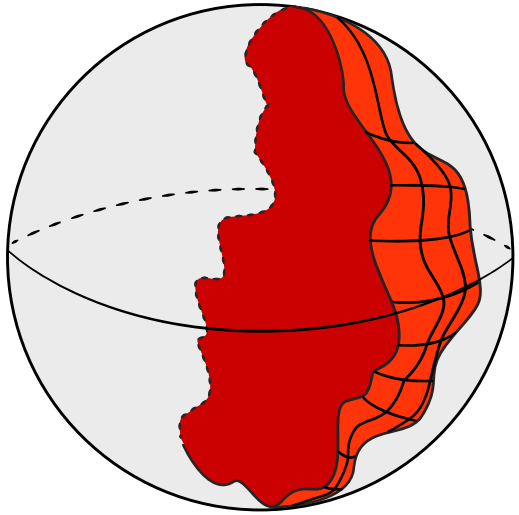

$\tilde{L}_n := L_n \times \mathbb{R}$

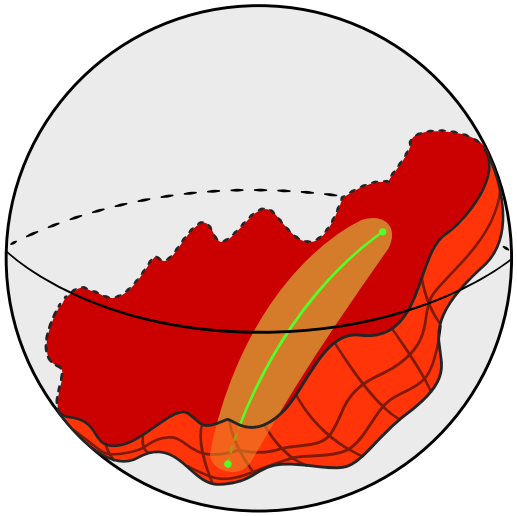

Topological Model:

$\tilde{M} = \mathbb{H}^2 \times \mathbb{R}$

Bad: $\mathrm{diam}_{\mathbb{E}^3}(\tilde{L}_n)$ is large

Possible Geometric Models:

Two ways for $\tilde{L}_n$ to sit in $\mathbb{H}^3$
